

Example of API-Like Documentation

At Tier1 Financial solutions, the documentation team was requested to provide configuration documentation for their native API-like registry paths. I led the team to standardize this content, which was often provided in disparate Microsoft Word or Excel formats. I based the styling on existing API content I viewed on the web.

Note, this content is considered proprietary information by Tier1 Financial Solutions, and I've provided only a one-page excerpt with annotations describing the structure.

Attribute	Description	Supported Values	Default
Selected	Defines which priority level will be default selected when users launch the dialog.	TRUE FALSE When set to TRUE, the corresponding priority level will be automatically selected.	n/a

4.4.5 Notification Check Boxes

The Notification Me and Notify Assignee check boxes at the bottom of the dialog can be configured with the following AFR attributes.

AFR Path: ACE.Core.QuickAdd.Layouts.QAT.Settings.Notification

Attribute	Description	Supported Values	Default
NotifyAssigneeLabel1	Defines the label text for the Notify Assignee check box.	STRING	Notify Assignee on Creation
NotifyMeLabel1	Defines the label text for the Notify Me check box.	STRING	Notify Assigner on Completion
NotifyAssignee	Enable/disable the Notify Assignee check box.	TRUE FALSE	FALSE
NotifyMe	Enable/disable the Notify Me check box.	TRUE FALSE	FALSE

Enhancement Details

AFR Path is the equivalent of an API path and endpoint, and we attempted to highlight this with the styling.

Attributes are the equivalent of API parameters.

We included a link/button to the new feature where it was fully documented.
